

# **Are the optical ports on the switch independent**

## Overview

---

The optical ports on the switch are usually paired together, with one TX sender and one RX receiver. In situations where there's a shortage of Ethernet ports, some users may insert Ethernet port modules into optical ports to connect with copper cables for data transmission. This design enables end-to-end optical signal transmission, avoiding the conversion between electrical and optical signals at the switch port level. SFP+ is an optical fiber module, an optical transceiver that is hot-swappable and independent of communication protocol, and an upgrade of SFP. RJ45 ports serve access-layer copper connections; SFP/SFP+ ports enable flexible 1G/10G uplinks; SFP28 delivers 25G for modern data centers; QSFP+ and QSFP28 support high-density 40G/100G spine-leaf.
