Overview

Fiber optic patch panels support different fiber optic cables, beginning at OM1, through OM5, with the higher number cables offering greater performance. A fiber patch panel is a mounted enclosure—either rack-mounted or wall-mounted—used to terminate, manage, and interconnect multiple fiber optic cables. They are commonly used to organize in-wall Ethernet cable runs, with cables running from Ethernet wall jacks to patch panels housed in central server rooms. The panel itself is made from blank ports on one side, and a termination point or keystone jack on the other side. It provides a central point where incoming fiber cables can be connected to outgoing patch cords, making the network structured, accessible, and easy to maintain.
