

Disadvantages of 16-core optical fiber cable

Overview

Fiber optic cable is getting very difficult to splice that means it is not easy task. A fiber optic cable is formed by drawing glass or a special sort of plastic, which can transmit light from one end of the fiber to a special end. Optical fiber is rising in both telecommunication and data communication due to its unsurpassed advantages: faster speed with less attenuation, less impervious to electromagnetic interference (EMI), smaller size and greater information carrying capacity. It can support to data transmission up to 10's KM in distance, whereas copper cable has limited to 328 foot for transmission. Electromagnetic interference (EMI) isn't a problem for optical fibers, since they don't carry electrical signals; nearby motors, transformers, or radio frequencies won't interfere with data flow.
