

How to check the loss of an optical module

Overview

Use an optical power meter to test the receive power of the port and check whether the optical fiber is disconnected. If the optical module is installed on a GE port, run the display interface `GigabitEthernet x/x/x` command to view port information when the optical module is inserted, including the rate and wavelength. Understanding how to troubleshoot and prevent a failing optical module is vital for good network stability. Because optical networks depend on precise power balance, continuous monitoring and accurate diagnosis are essential for maintaining link reliability and long-term equipment health.
